## 1.0 OVERVIEW

### 1.1 Scope of Document

The logic specified in this document is intended to provide functional requirements for PLC-G800 Headworks Pre-treatment. Refer to document A-0102-AFRS-G001 for PLC-G800 Raw Sewage Intake, Pumps and Wet Well functional requirements. Refer to document A-0102-AFRS-A001 for general requirements and standard equipment classes. Refer to PCN Alarm, Range and Settings List for operator setting ranges.

This Functional Requirement Specification (FRS) document is intended to provide an initial basis for development of the PLC and HMI application functionality for the specific process area described herein. The Contractor must provide further development of the PLC and HMI functionality described in this document for a complete and functional system. It is written from a technical perspective and is intended to be read in parallel with the Process Control Narratives (PCNs), the associated Process and Instrument Diagrams (P&IDs), the Instrument Loop Drawings (ILDs) and the other PLC related contract documents. In the event of any discrepancy or any ambiguity, the PCNs, P&IDs, ILDs and other contract documents take precedence (in no specific order of importance) over the FRS documents. Any significant discrepancy should be clarified with the Contract Administrator. All discrepancy resolutions should be documented and submitted as part of the as-built markups. If there are discrepancies from a scope of work perspective, the more stringent requirement shall apply. All scope of work discrepancies should be clarified with the Contract Administrator.

Control functions are described using pseudo code and encapsulated in classes (some of which are commonly applicable for similar or identical equipment systems). These classes may therefore be instantiated as necessary to control similar types of equipment throughout the facility. Each class defines a control interface whose inputs and outputs are interconnected to implement the overall process control strategy as defined by the PCNs, P&IDs, ILDs, etc. and the FRS document. The specific area FRS documents are supported by the General FRS document which provides common definitions for software development required throughout the entire facility.

While the FRS documents provide specific guidance with respect to software development, they should not be presumed to be comprehensive of all software development requirements. Ultimately the P&IDs, the PCNs and the ILDs will govern and take precedence. It is the responsibility of the Contractor to utilize its expertise to provide a fully functional set of developed software in accordance with the contract documents even if not described within the FRS document at no additional cost to the contract. It is the specific responsibility of the Contractor to identify, seek clarification and ultimately resolve any issues of ambiguity, interpretation, uncertainties or discrepancies between the FRS documents and the associated contract documents. This responsibility extends to the need for consultation, as necessary, with the process designers, process equipment vendors, the Engineer, the Owner and any other relevant stakeholders to resolve any issue in accordance with the Contractor's legal obligations for the delivery of the work.

The DCS replacement logic specified in this document is intended to provide equivalent functionality to the existing DCS logic. However, there are instances where the functionality was modified because of the inherent differences in implementation between PLC and DCS functionality and architecture.

### 1.2 Associated Documents

The documents associated with the functional requirements are listed below. Additional P&ID drawings may be referenced in this document.

**Table 1.2-1 Associated Documents**

## 2.0 GENERAL REQUIREMENTS

Refer to document A-0102-AFRS-A001 for general requirements and standard classes.

### 2.1 Graphic Displays

Create Area Overview, Process Graphic and Detail displays as per City of Winnipeg HMI Layout and Animation plan document (612620-0015-40ER-0001) and General Functional Requirements Specification A-0102-AFRS-A001.

The following tables provide guidance on the minimum anticipated groupings of process displays, however, these should not be considered as fully defined and modifications and additions may be required.

Note that only major or representative equipment and devices are explicitly shown in the graphic display tables. Include other devices as required for a complete HMI.

Refer to General Functional Requirements Specification A-0102-AFRS-A001 for Level 1 graphics.

## 2.3 Inputs from Other PLCs

Some variables will be shared among different areas of the plant. They will be communicated via the Fibre Ethernet redundant ring connecting the PLCs. Variables that are read from other PLCs are listed below, along with their default value in the event of a communication failure.

The following table provides guidance on the minimum anticipated variables that are read from other PLC along with their default value in the event of a communication failure, however, these should not be considered as fully defined and modifications and additions may be required.

Input	Description	Source PLC	Value On Communication Error
GBL_K800_XC-G36(2/3)1_OpenReq	HRC Train (1/2) Influent Channel Gate Open Request	PLC-K800	Last
GBL_K800_HA-K1(1/2)06_Alm	HRC (1/2) Process Stop Hand Switch Summary	PLC-K800	Last
GBL_K800_HA-K1(1/2)06_AlmErr	HRC (1/2) Process Stop Hand Switch Summary Bad Quality	PLC-K800	True
GBL_K800_XC-G36(2/3)2_OpenReq	HRC Train (1/2) Influent Flushing Water Open Request	PLC-G800	False

## 2.4 Logic and variables for other PLCs

The following sections provide guidance on the minimum anticipated variables and logic required from this PLC for other PLCs, however, these should not be considered as fully defined and modifications and additions may be required.

## 3.2 G2 – Screenings

P&ID Drawing: PPID-G201 and PPID-G202

Raw wastewater from the influent pump station is discharged to the screens influent channel and distributed between four screen channels. Each channel is equipped with a vendor package mechanical perforated plate screen (SCR-G211, SCR-G212, SCR-G213, SCR-G214) and motorized inlet slide gate (XV-G2111, XV-G2121, XV-G2131, XV-G2141)

### 3.2.1 Screen Unit Control Station

A screen unit consists of a mechanical screen vendor package and its associated screen channel inlet gate. The screen unit started / stopped by opening / closing its screen inlet channel gate and enabling / disabling its mechanical screen vendor package.

**Table 3.2-1 YC-G21(1/2/3/4)9 / Screen SCR-G21(1/2/3/4) Unit Control Station**

### 3.2.2 Screen Unit Duty Selection

The number of screen units in operation at any given time varies depending on the plant influent flow rate and whether the flow is increasing or decreasing. The plant influent flow rate is the sum of the flow rates measured by the four raw sewage pump flow meters (FI-G1100). The operator specifies the flow rate to start and the flow rate to stop operation of the second duty, third duty, and fourth duty screen units at the plant HMI. Operation of the first duty screen unit is always required.

For each screen duty the flow rate to stop should be slightly lower than the associated flow rate to start in order to avoid unnecessary sudden stopping or restarting of the screens caused by fluctuations in the flow rate as the flow increases or decreases.

The second duty screen unit is required when the total plant influent flow rate (FI-G1100.Out) exceeds an operator defined flow setting (YC-G2100\_StrLag\_Setting) for an operator defined time in seconds (YC-G2100\_StrLag\_TD\_Setting).

 <b>SNC-LAVALIN</b>	<b>FUNCTIONAL REQUIREMENTS SPECIFICATION</b> Headworks – Pre-treatment		Document Code: A-0102-AFRS-G002
			Revision: 01
Client: City of Winnipeg	Project: SEWPCC Upgrading / Expansion Project	Package / Area: PLC-G800	

The second duty screen unit is not longer required when the total plant influent flow rate (FI-G1100.Out) is below an operator defined flow setting (YC-G2100\_StpLag\_Setting) for an operator defined time in seconds (YC-G2100\_StpLag\_TD\_Setting).

**Table 3.2-2 YC-G2100\_RunLag / Second Duty Screen Unit Required**

<b>Instance</b>	YC-G2100_RunLag		
<b>Class</b>	DiscretelA		
<b>Inputs</b>	<b>Parameter</b>	<b>Source</b>	<b>Type</b>

**Table 3.2-4 YC-G2100\_Run3Lag / Fourth Duty Screen Unit Required**

<b>Instance</b>	YC-G2100_Run3Lag		
Class	DiscretelA		
Inputs	<b>Parameter</b>	<b>Source</b>	<b>Type</b>
	In	((FI-G1100.Out >= YC-G2100_Str3Lag_Setting) for more than YC-G2100_Str3Lag_TD_Setting seconds OR YC-G2100_Run3Lag.Out) AND NOT ((FI-G1100.Out < YC-G2100_Stp3Lag_Setting) for more than YC-G2100_Stp3Lag_TD_Setting seconds) AND YC-G2100_Run2Lag AND YC-G2100_RunLag OR LI-G2011.AlmHi OR LAH-G2021.Alm	Link
Alarms	N/A		

All the previous duty settings can be modified by an operator with security level M or higher. The operator HMI settings should be checked before being used so that:

- YC-G2100\_Str3Lag\_Setting >= YC-G2100\_Str2Lag\_Setting >= YC-G2100\_StrLag\_Setting
- YC-G2100\_StpLag\_Setting <= YC-G2100\_StrLag\_Setting
- YC-G2100\_Stp2Lag\_Setting <= YC-G2100\_Str2LagSetting
- YC-G2100\_Stp3Lag\_Setting <= YC-G2100\_Str3Lag\_Setting

The operator assigns the duty screen units at the plant HMI. Since only one or two screen channels will normally be in operation, automatic periodic rotation is recommended in order to maintain all screens in reliable working condition.

### 3.2.3 Screen Channel Scouring

An inlet grit gate seating area deposit scourge will be periodically performed to reduce grit deposition, which could impede proper closing. The gates of the operating channels will be periodically partially closed to increase the velocity through the gate opening in order to scour grit deposits from the gate seating area.

 <b>SNC-LAVALIN</b>	<b>FUNCTIONAL REQUIREMENTS SPECIFICATION</b> Headworks – Pre-treatment		Document Code: A-0102-AFRS-G002
			Revision: 01
Client: City of Winnipeg	Project: SEWPCC Upgrading / Expansion Project	Package / Area: PLC-G800	

A retentive timer accumulates the run enable time for each screen (KQI-G21(1/2/3/4)5). If the accumulator exceeds the hot washing due “Screen Channel Scour Repeat Cycle Time” (KQI-G2100\_ScourCycle\_Setting [Hrs.]) a screen channel scour cycle will be initiated if no other screen is in operation, only one screen is required due to raw sewage flows and there is no high level in the screens influent channel.

The scour is performed for the “Screen Channel Scour Run Time” (YC-G2100\_ScourRunTime\_Setting [seconds]), by modulating the screen channel inlet gate to maintain “Screen Channel Scour Level Differential” (LDIC-G2100\_ScourLD\_Setting [mm]) between the screen influent channel (as measured by LI-G2011) and the screen influent channel level sensor (as measured by LI-G21(1/2/3/4)3-1).

KQI-G2100\_ScourCycle\_Setting, YC-G2100\_ScourRunTime\_Setting and LDIC-G2100\_ScourLD\_Setting are real numbers that can be modified by an operator with security level M or higher. The operator HMI settings should be range checked before being used.

### 3.2.4 Screen Hot Washing

P&ID Drawing: PPID-G201, PPID-G202 & PPID-G508

The ability to periodically wash the screens with hot water is provided to remove accumulated fats and grease from the perforated plates. An electric hot water heater provides hot water storage to hot wash one screen at a time. Motorized three-way valves on the wash water supply piping to each screen control the source of wash water, either cold for normal screen operation or hot for hot washing.

A retentive timer accumulates the run enable time for each screen (KQI-G21(1/2/3/4)5). If the accumulator exceeds the hot washing due "Screen Hot Wash Repeat Cycle Time" (KQI-G2105\_HotWashCycle\_Setting) a screen hot washing cycle will be initiated if no other screen is being hot washed and the elapsed time since any screen has hot washed (as measured by retentive timer KQI-G5331) exceeds the "Hot Water Recovery Time" (KQI-G5331\_RecovTime\_Setting).

KQI-G2105\_HotWashCycle\_Setting and KQI-G5331\_RecovTime\_Setting are real numbers in hours that can be modified by an operator with security level M or higher. The operator HMI settings should be range checked before being used.

### 3.2.5 Sluice Water Pumps

P&ID Drawing: PPID-G204

There are two sluice water pumps (P-G221, P-G222), one duty and one standby. The pump discharge header is equipped with a pressure transmitter (PIT-G2201) to detect duty pump failure (on low pressure) and pipe blockage (on high pressure).

In the event of pump low discharge pressure while the lead pump is running, the lead pump stops and the lag pump starts. When the pumps are in auto, only one pump at a time is allowed to run.

### 3.2.6 Disposal Bins

P&ID Drawing: PPID-G203

There are two disposal bins (TK G233, TK G234) that receive dewatered grit from the grit classifiers and compacted and dewatered screenings from the screenings washer/compactors. Each bin serves one washer/compactor (WCP G231, WCP G232, respectively) and one grit classifier (GRP G341, GRP G342, respectively). Each bin is positioned on a weigh scale (WE/WIT G2331, WE/WIT G2341) to monitor the total weight of the bin and the grit and screenings. When a bin is full it is picked up by the hauler and taken to a landfill for emptying.

An infrared sensor (ZS G2332, ZS G2342) at each weigh scale detects the presence or absence of a disposal bin on the weigh scale. These sensors are also used to aid the hauler in pushing the bin into proper position on the scale.

The operator selects either local or remote mode (HL-G2300.Out is True in Remote) at the local control panel (LCP-G230) for disposal bin duty assignment. At least one disposal bin should be active at all times, the only exception is when disposal bin equipment stop (HA-G2300-2) is pressed.

#### 3.2.6.1. Disposal Bin Selection In Remote Mode

In remote mode, bin duty assignment is done automatically by the PCS. Normally only one bin is Active; however, both bins can be assigned Active in emergency situations.

 <b>SNC-LAVALIN</b>	<b>FUNCTIONAL REQUIREMENTS SPECIFICATION</b> Headworks – Pre-treatment		Document Code: A-0102-AFRS-G002
			Revision: 01
Client: City of Winnipeg	Project: SEWPCC Upgrading / Expansion Project	Package / Area: PLC-G800	

**Table 3.2-12 YC-G2300\_BinSel / Remote Disposal Bin Selection (Off for TK-G233 / On for TK-G234)**

<b>Instance</b>	YC-G2300_BinSel		
<b>Class</b>	OnOffSel		
<b>Inputs</b>	<b>Parameter</b>	<b>Source</b>	<b>Type</b>
	SelOffText	“TK-G233 Disposal Bin Remote Selection”	Const
	SelOnText	“TK-G234 Disposal Bin Remote Selection”	Const
	SelOffNotPerm	NOT YL-G2332.Out OR WI-G2331.AlmHi	Link
	SelOnNotPerm	NOT YL-G2342.Out OR WI-G2341.AlmHi	Link
	IntlkOn	See logic below	Link
	IntlkOff	See logic below	Link

Note: Interlocks have priority over permissives.

The PCS will automatically change the bin selection in local mode to follow the latest local activated bin. In remote mode the PCS automatically changes the bin selection when:

- The selected bin becomes full and the other bin is ready
- The washer/compactor or gates associated with the selected bin becomes not ready or gates not in position after 2 minutes of being selected
- The grit classifier or gates associated with the selected bin becomes not ready or valves are not in position after 2 minutes of being selected

### 3.2.6.3. Disposal Bin Activation In Local Mode

In local mode, bin duty assignment is done manually by the operator at the local control panel. In local mode there is no automatic checking of the bin status and no automatic switchover of the bins when they are full. Bin duty assignment should normally be in remote mode. Local mode should only be used for testing and maintenance purposes and emergency situations.

In Local mode (NOT HL-G2300.Out) the bin activation is toggled by the operator. A bin can be toggled off only after the one is on:

If NOT HL-G2300.Out AND rising edger of (HL-G2304.Out On Delay of .5 seconds (TBDC)) Then

//Toggle Bin TK-G233 Active status

If YC-G2330.CmdOn AND YC-G2340.CmdOn Then

Reset YC-G2330.OnAuto

Else

Set YC-G2330.OnAuto

Set YC-G2300\_BinSel\_SetOff // Change remote bin selection for bumpless transfer

Endif

Endif

#### 3.2.6.4. Disposal Bin Active Light

The disposal bin active light (YC-G230(4/5).OnAuto) has the following states:

- Off if the bin is not active ( NOT YC-G23(3/4)0.CmdOn ),
- Steady on when
  - the light test is pushbutton is pressed (HL-G2300-3.Out) or
  - the bin is active , the associated washer/compactors and grit classifier are ready with their corresponding gates and valves open (YC-G23(3/4)0.CmdOn AND YC-G23(1/2)0.Rdy AND XC-G23(1/2)1.ConfOpn AND YC-G34(1/2)0.Rdy AND XC-G34(1/2)4.Rdy AND XC-G34(1/2)1.ConfOpn AND XC-G34(1/2)2.ConfOpn AND XC-G34(1/2)3.ConfOpn)
- Blinking if the bin is active but the associated washer/compactors or grit classifier are not ready or any of the corresponding gates and valves are not open (YC-G23(3/4)0.CmdOn AND NOT(YC-G23(1/2)0.Rdy AND XC-G23(1/2)1.ConfOpn AND YC-G34(1/2)0.Rdy AND XC-G34(1/2)4.Rdy AND XC-G34(1/2)1.ConfOpn AND XC-G34(1/2)2.ConfOpn AND XC-G34(1/2)3.ConfOpn) )

#### 3.2.6.5. Ready for Hauler

When a full bin becomes inactive a message will be sent message to haulers for bin pickup. The operator can manually select a bin that is not full as ready for hauler pick up. The alarm notification system will escalate the message if the bin pick up message is not acknowledged by the hauler.

Send message via alarm notification system to Hauler to pick up Disposal Bin TK-G234 on YC-G230\_PickUpSel.SelOut.

### 3.2.7 Screen Washers / Compactors

Screenings are discharged from the sluice to two washer/compactors (WCP G231, WCP G232). Each washer/compactor is equipped with a hopper to receive the screenings and carrier water, a constant speed motor-driven auger to compact and dewater the screenings, a wash water connection to remove organic material from the screenings, and a discharge tube to facilitate compaction and dewatering of the screenings. The compacted and dewatered screenings from each washer/compactor are discharged to the associated disposal bin (TK G233, TK G234, respectively). The drainage water, organic material, wash water, and sluice carrier water return by gravity to the screens influent channel. Under normal operating conditions only one washer/compactor is in operation at a time and operation alternates back and forth between the two washer/compactors depending on which disposal bin is active.

The raw screenings and carrier water are discharged from the sluice into the inlet hopper located above the opening to the auger housing. The carrier water passes through a screen below the auger, while the screenings are retained by the screen and transported by the auger into a compaction zone where they are compressed and dewatered. Wash water is used to remove organic material from the screenings.

In remote, the washer/compactor is enabled and associated sluice gates are commanded to open if its corresponding disposal bin active.

## 3.3 G3 – Grit

### 3.3.1 TK-G321&2 Grit Slurry pumps

P&ID Drawing: PPID-G302

There are three grit slurry pumps, two normal duty (P G323, P G325) and one common standby (P G324). Each normal duty pump is dedicated to the associated grit tank (TK G321, TK G322, respectively). The standby pump can serve as backup to either duty pump.

### 3.3.2 TK-G331&2 Grit Tanks

P&ID Drawing: PPID-G303 & PPID-G301

TK-G331&2 grit tanks are not always in operation. In Auto mode, operation of the grit tanks depends on the plant influent flow rate. Once in operation, the flow to TK-G321&2 grit tanks is maintained by redirecting some of the flow to TK-G331&2 grit tanks. The flow to TK-G321&2 is controlled indirectly by maintaining the screens effluent channel level.

#### 3.3.2.1. Grit tanks auto start conditions

In Auto mode, TK-G331&2 will be in operation when the plant influent flow exceeds 220 ML/d “Flow Rate to Start Grit Tanks 3 & 4” (YC-G3300\_FlowRun\_Setting setpoint by operator) for greater than TBDC minutes “Wait Time to Start Grit Tanks 3 & 4” (YC-G3300\_FlowRunDly\_Setting setting by operator), as measured using flow meters on the influent pump discharge pipes.

TK-G331&2 Grit Tanks are stopped when the plant influent flow is below TBDC ML/d “Flow Rate to Stop Grit Tanks 3 & 4” (YC-G3300\_FlowStop\_Setting setting by operator) for more than TBDC minutes “Wait Time to Stop Grit Tanks 3 & 4” (YC-G3300\_FlowStopDly\_Setting setting by operator).

YC-G3300\_FlowRunDly\_Setting [minutes], YC-G3300\_FlowStopDly\_Setting [minutes], YC-G3300\_FlowRun\_Setting [ML/d] and YC-G3300\_FlowStop\_Setting [ML/d] are real numbers that can be modified by the operator with security level M or higher. The values should be checked so that YC-G3300\_FlowRun\_Setting > YC-G3300\_FlowStop\_Setting. The operator HMI setpoints should be range checked before being used.

	CtrlLoDly	YC-G3300_FlowStopDly_Setting * 60 000 [ms/minutes]	Link
Alarms	N/A		

#### 3.3.2.2. LIC-G3201 / Screens effluent channel level control

The PCS records the current level in the screens effluent channel LIC-G3201.Out in YC-G3300\_ChannelLvISP when the plant influent flow reaches YC-G3300\_CtrlHiSP (rising edge).

If the plant influent flow is less than YC-G3300\_CtrlHiSP, YC-G3300\_ChannelLvISP is updated with the screens effluent channel high alarm level setting (LIC-G3201.AlmHiLmt) when a high level alarm (LI-G3201.AlmHi) is detected (rising edge) before starting the TK-G331&2 Grit Tank Sequence.

 <b>SNC-LAVALIN</b>	<b>FUNCTIONAL REQUIREMENTS SPECIFICATION</b> Headworks – Pre-treatment		Document Code: A-0102-AFRS-G002
			Revision: 01
Client: City of Winnipeg	Project: SEWPCC Upgrading / Expansion Project	Package / Area: PLC-G800	

For the case where the system is operated in manual, YC-G3300\_ChannelLvISP is updated to the current level in the screens effluent channel LIC-G3201.Out when the system is commanded to run (YC-G3300.CmdRun rising edge) in manual (YC-G3300.CtrlAuto is False).

YC-G3300\_ChannelLvISP should be range limited to LIC-G3201.AlmHiLmt.

YC-G3300\_ChannelLvISP is not updated while TK-G331&2 Grit Tanks are commanded to run (YC-G3300.CmdRun is True).

### 3.3.3 TK-G331&2 Grit Slurry pumps

P&ID Drawing: PPID-G304

When in service, Grit is periodically pumped from the grit tank. There are two grit slurry pumps (P-G335, P-G336), one duty and one standby for both tanks. XV-G3313 and XV-G3323 are used to remove grit from TK-G331 and TK-G332 respectively. The grit is removed from each tank sequentially, the operator can select how long grit will be removed from each tank (YC-G3301\_TK33(1/2)\_PumpGritTime) and how long to wait to till the next cycle (YC-G3301\_PumpGritDly).

YC-G3301\_TK33(1/2)\_PumpGritTime<sup>2</sup> are modifiable by the operator with security level M or higher. The operator HMI setting should be range checked (0 to 100 minutes) before being used.

YC-G3301\_PumpGritDly<sup>3</sup> are modifiable by the operator with security level M or higher. The operator HMI setting should be range checked (0 to 500 minutes) before being used.

### 3.3.4 Grit Classifier

P&ID Drawing: PPID-G305

Grit slurry pumped from the grit tanks is received by two grit classifiers (GRP-G341, GRP-G342). Each classifier consists of a settling tank equipped with a motor driven screw conveyor and three cyclones. The three cyclones on grit classifier GRP-G341 (CYC-G341 1, CYC-G341 2, CYC-G341 3) receive grit slurry from Grit Tank 1, Grit Tank 2, and Grit Tanks 3 & 4, respectively. Similarly, the three cyclones on grit classifier GRP-G342 (CYC-G342 1, CYC-G342 2, CYC-G342 3) also receive grit slurry from Grit Tank 1, Grit Tank 2, and Grit Tanks 3 & 4, respectively. The washed and dewatered grit from each grit classifier is discharged to the associated disposal bin

 <b>SNC-LAVALIN</b>	<b>FUNCTIONAL REQUIREMENTS SPECIFICATION</b>  Headworks – Pre-treatment		Document Code: A-0102-AFRS-G002
			Revision 01
Client: City of Winnipeg	Project: SEWPCC Upgrading / Expansion Project	Package / Area: PLC-G800	

(TK-G233, TK-G234, respectively). The separated water and organics are returned to the screens effluent channel. Each grit classifier is sized to handle the combined grit slurry from all grit sources simultaneously under peak loading conditions. Under normal operating conditions only one grit classifier is in operation at a time and operation alternates back and forth between the two grit classifiers depending on which disposal bin is active.

The settling tank provides a quiescent pool where the grit particles undergo final separation and washing. The settled grit is transferred along an inclined trough by a screw conveyor and lifted above the water level for further dewatering and washing before being discharged to the disposal bins. Water and organic material is discharged over a weir and returned to the screens effluent channel. The weir elevation can be manually adjusted by the operator to achieve the optimal liquid depth in the settling tank, producing grit with a minimal amount of organics. Each grit classifier has a wash water supply line equipped with a motorized valve (XV G3414, XV G3424) to wash organic material from the grit before it is discharged to the disposal bin. Each classifier is also equipped with a motion detector (XE G3415, XE G3425) to confirm rotation of the screw conveyor and a cable actuated safety switch (HSS G3416, HSS G3426) to manually shut off the screw conveyor in an emergency.

There are three separate grit slurry lines feeding the grit classifiers, one from Grit Tank 1 (TK G321), another from Grit Tank 2 (TK G322), and a common one from Grit Tanks 3 & 4 (TK G331, TK G332). Routing of these flow streams to the two grit classifiers is controlled by six motorized grit slurry inlet valves, two for each grit slurry line (XV G3411 and XV G3421, XV G3412 and XV G3422, XV G3413 and XV G3423, respectively).

Normally, the grit classifiers run intermittently according to the “Grit Classifier On Time” (YC-G3400\_GRP\_OnTime\_Setting) and “Grit Classifier Off Time” (YC-G3400\_GRP\_OffTime\_Setting) specified by the operator at the plant HMI. To prevent overloading of the auger drive at high plant influent flows when grit loading is likely to be highest, the classifiers will automatically switch to continuous operation when the plant influent flow rate is above the “Flow Rate for Continuous Grit Classifier Operation” (YC-G3400\_GRP\_FlowRateCont\_Setting [ML/d]) specified by the operator.

YC-G3400\_GRP\_OnTime\_Setting, YC-G3400\_GRP\_OffTime\_Setting and YC-G3400\_GRP\_FlowRateCont\_Setting are real numbers than can be modified by an operator with security level M or higher.

The wash water valve is open whenever the associated grit classifier is running.

A grit classifier system consist of a grit classifier equipment (GRP-G34(1/2)) with its corresponding grit classifier auger low speed detection and wash water valve. The grit classifier system control station enables/disables the operation of the grit classifier as per grit classifier on time and grit classifier off time or continuous operations depending on influent flow.

Alarms	N/A		

Grit Classifier Equipment Run Request is defined as follows:

```

If YC-G23(3/4)0.CmdOn Then
  If (FI-G1100.Out > YC-G3400_GRP_FlowRateCont_Setting) for more than YC-
    G3400_GRP_OffTime_Setting Then
    Set YC-G3400_GRP_FlowRateCont_Run
  EndIf
  If (YC-G3400_GRP_FlowRateCont_Run AND (FI-G1100.Out < YC-
    G3400_GRP_FlowRateCont_Setting)) for more than YC-G3400_GRP_OnTime_Setting Then
    Reset YC-G3400_GRP_FlowRateCont_Run
  EndIf
  If YC-G3400_GRP_FlowRateCont_Run Then
    YC-G34(1/2)0_RunReq := True
  Else
    YC-G34(1/2)0_RunReq is on for YC-G3400_GRP_OnTime_Setting and off for YC-
    G3400_GRP_OffTime_Setting
  EndIf
Else
  YC-G34(1/2)0_RunReq := False
  Reset YC-G3400_GRP_FlowRateCont_Run
EndIf

```

### 3.3.5 TK-G331 & TK-G332 Grit Blowers

P&ID Drawing: PPID-G306

Grit Tanks TK-G331 & TK-G332 utilize process air released through a submerged diffuser to create a rolling flow pattern within the tank that enhances grit separation while maintaining organic material in suspension. Air is supplied to the grit tanks by two grit blowers (B-G353, B-G354), one duty and one standby.

### 3.3.6 Channel Aeration Blowers

P&ID Drawing: PPID-G307

The wastewater channels within the headworks facility are aerated to help maintain sand and grit in suspension and minimize settling. Air is supplied continuously to the channels by two channel aeration blowers (B G351, B G352), one duty and one standby.
