RE: Geotechnical Investigation – Maryland Street Pavement Renewals

1.0 Introduction

ENG-TECH Consulting Limited (ENG-TECH) completed the requested geotechnical investigation (pavement cores and test holes) along Maryland Street between Woodrow Place and Broadway. The pavement cores and test holes were conducted as follows:

- Five (5) test holes on Maryland Street (East and West curb lanes), between Woodrow Place and Sara Avenue.
- Eight (8) pavement cores on Maryland Street (East and West curb lanes) between Woodrow Place and Broadway.

The geotechnical investigation field work and laboratory program were conducted in accordance with the City of Winnipeg Geotechnical Investigation requirements for Public Works Projects (September 2015) and the supplementary information provided by the engineer from the City of Winnipeg.

2.0 Scope of Work

The scope of work for the project was as follows:

- Clear all underground public services at the locations of the test holes.
- Maintain at least one (1) lane of traffic, and adhering to the Manual of Temporary Traffic Control.
- Core a total of eight (8) holes through the existing pavement structure at the location previous mentioned using a 150 mm diameter core barrel, and retain the cores for measurements and photographs.
- Drill five (5) 125 mm diameter test holes to 3.0 m below the surface of the pavement structure, and classify the underlying soils and collect samples from the auger flights at regular intervals, and retain the samples for laboratory testing.

- A laboratory testing program consisting of moisture contents, Atterberg Limits, particle size analyses and California Bearing Ratio (CBR) on select samples.
- A report outlining the work conducted, including pavement core and test hole summary tables, laboratory test results, a site plan showing the test hole and pavement core locations, UTM coordinates, photographs, and test hole summary logs.

3.0 Field Program

ENG-TECH conducted the coring and test hole drilling program on December 3rd and 6th, 2019 at Maryland Street (East and West curb lanes) from Woodrow Place to Broadway. The cores were obtained using a 150 mm diameter core barrel owned and operated by Di-Tech International Inc., whereas the test holes were drilled using a 125 mm diameter solid stem continuous flight augers using a CME 75 truck mounted drill rig owned and operated by Subterranean Manitoba Ltd. The test holes were advanced to 3.0 m below the pavement structure on Maryland Street at the locations as shown on Figure 1.

Soil samples were collected off the auger flights at regular depth intervals of 0.1, 0.4, 0.7, 1.1, 1.5 and 2.0 m, as specified in the supplementary information provided by the engineer from the City of Winnipeg, then the test holes were backfilled with soil auger cuttings and bentonite. Compacted cold mix asphalt was placed upon the completion of drilling. The core thicknesses and stratigraphy at the location of the test holes are outlined on Tables 1 and 2, and the attached test hole summary logs. The pavement core and test hole locations, UTM coordinates and offsets from the curbs are shown on Figure 1. Detailed stratigraphy descriptions are outlined on the test hole summary logs.

4.0 Laboratory Program

The soil samples collected and the pavement structure cores were retained for testing in ENG-TECH'S laboratory. The moisture content of each sample was determined and select samples were tested for particle size, Atterberg Limits and California Bearing Ratio (CBR). The pavement structure core thicknesses were measured and photographed. The moisture content, particle size and Atterberg Limit test results are summarized on Table 1, and the attached test hole summary logs. The CBR and Particle Size Analysis results are shown on separate reports, with the test hole summary logs and photographs of each core attached to this report.

5.0 Closure

ENG-TECH trusts this is all the information required. If you have any questions, please contact the undersigned.

Sincerely,
ENG-TECH Consulting Limited

Paula Filizzola Pinheiro Chagas

File No.: 19-035-01
 Ref. No.: 19-35-1-2

Attention: Mark Vogt, M.Sc., P.Eng.

Project: MARYLAND STREET PAVEMENT RENEWALS, WINNIPEG, MANITOBA

Test Hole No.: 2	Sample No.: 3	Depth: 0.7 m
Sampled By: ENG-TECH (Paula Chagas)	Sampling Method: Auger cutting	Source: Project site
Date Sampled: Dec 2/19	Date Received: Dec 2/19	Date Tested: Dec 19/19
Method: <input checked="" type="checkbox"/> A (Multipoint) <input type="checkbox"/> B (Single Point)	Drying Method: <input checked="" type="checkbox"/> Air <input type="checkbox"/> Oven	

Liquid Limit (%): 74 Plastic Limit (%): 27 Plasticity Index (%): 47

Estimated Percentage of sand/gravel particles retained on 0.425mm sieve: 8.5

Classification:

ASTM D2487: CH, fat clay; ASTM D3282: A-7-6 (47)

Comments:

As received moisture content: 35.3%.
