D2.2 At the pre-commencement meeting, the Consulting Contract Administrator will identify additional personnel representing the Consulting Contract Administrator and their respective roles and responsibilities for the Services.

#### D3. INTRODUCTION AND BACKGROUND

D3.1 The administrative structure for the City of Winnipeg is a Chief Administrative Officer (CAO) who is the head of the public service and provides overall leadership to all City departments.

D3.2 This assignment generally encompasses undertaking of engineering services related to inspection and rehabilitation of the bridge decks at both Pembina Highway Bridge twin structures over La Salle River.

#### D3.3 Pembina Highway Bridge over La Salle River – B224:

D3.3.1 Bridge Geometry and Components:

- (a) The existing Pembina Highway Bridge over La Salle River consists of twin structures in the Northbound and Southbound directions. Each structure is a 3-span (26.25m / 36.00m / 26.25 m) 88.5 m long skewed concrete bridge supported by concrete abutments and piers. Abutments are founded on precast concrete Hex piles while piers are founded on steel HP pile foundations. The bridges were constructed in 1996 and are 27 years old.
- (b) Each structure is approximately 15.3 m wide and provides 2 lanes of traffic with shy distances, along with a 3.0 m wide sidewalk (one for each structure) protected by a concrete traffic barrier and planters. The roadway width is approximately 10.2 m in each direction. Each bridge superstructure is composed of a cast-in-place concrete multi-cell box deck (total of 7 cells) with a top flange and a total thickness of 240mm and reinforced with epoxy coated reinforcing bars. The cell depth increases near the piers creating an arch-shape girder with an overall depth of 4.7 m. Approach slabs of varying length are located at each end of both structures.
- (c) The superstructure for each bridge is supported over total of 8 spherical bearings at each substructure unit.

D3.3.2 Maintenance History:

- (a) The deck concrete upper lift contains concrete mix with macro steel fibers. At the top of and just below the riding surface steel fibers within the concrete matrix have since corroded leading to numerous small concrete spalls and delamination on the bridge deck resulting in a pock-marked appearance.

- (b) From 2001 to 2004, several rehabilitations were completed on the structures and their vicinity:
  - (i) The roadway profiles tying into the bridge were raised by foam jacking underneath the approach slabs and roadway slabs at both ends of the structures.
  - (ii) Several abutment bearings lower plates were repositioned to be in alignment with the top plates. These bearings have been monitored since the fixing bolts for the lower plates were permanently removed.
  - (iii) A non-skid polymer overlay was applied to the entire deck surface on both structures. The overlay generally in poor condition and peeling off the concrete surface.
- (c) In 2017, transition slabs at both ends of the bridge structures were replaced, while salvaging the connecting dowels to the existing approach slabs.
- (d) Recent inspections show signs of rotation for both structures and bearings that are not in proper alignment causing shearing of the existing keeper plates.
